Going From Brew QC To Fermentation QC

The below video shows how to use the Brew QC feature from within Orchestrated Software.

Summary

There is an important link between Brew/Cook QC & Fermentation QC. As a brewer is inputting their original gravity & pH values through Brew QC, that data is being stored within Orchestrated, as you move to collect your daily fermentation qc readings we display the weighted-average of the gravity & pH from your brews. This requires MPN.

Usage

1. As you brew, open Brew QC and input the Original Gravity & Original pH of your brews
2. Once you have created 'Green Beer' and launch the Cellar worksheet. Select the tank you just knocked out into and press **Ferm QC**.
3. On Fermentation QC, the weighted-average of Original Gravity & pH are displayed in the top of the form. Once you add your first Ferm QC document, the weighted-average is stored in the database.
